

Concertina Wire Product Description

Concertina Wire

Concertina wire is a type of high-security fencing material made from galvanized steel wire formed into sharp-edged coils. It is widely used for perimeter protection in industrial facilities, military zones, warehouses, border security, prisons, construction sites, and restricted areas. The spiral coil design allows easy installation while providing a strong physical barrier against intrusion and trespassing.

The wire is manufactured using durable, corrosion-resistant steel to ensure long-lasting performance in outdoor environments. Its sharp barbs are evenly spaced to maximize security and deterrence. Concertina wire is available in different coil diameters, thicknesses, and blade types depending on the application requirements. The product shown in the image is stored in large coiled bundles inside a warehouse, indicating bulk industrial-grade production and supply.

Key Features: High tensile strength and durability
Corrosion and weather resistance
Easy to install and maintain
Provides effective perimeter security
Suitable for industrial and commercial applications
